1.0 ABSTRACT IDENTIFIER

=====

Current trajectories in artificial intelligence rely on scaling laws, probabilistic sequence modeling, and reactive safety measures such as Reinforcement Learning from Human Feedback (RLHF). These post hoc alignment strategies have produced profound structural vulnerabilities: capability gains without a constitutional rule over which internal state transitions count as valid.

Meta's JEPA program is framed as progress toward world-oriented representation learning rather than pure surface continuation (Assran et al., 2023). Safe Superintelligence, founded by Ilya Sutskever and collaborators, is organized around treating superintelligence safety as a primary objective rather than a secondary correction (Reuters, 2024). These developments point to a deeper requirement: advanced intelligence needs a constitutional constraint layer that defines admissible reasoning states BEFORE output selection.

This manuscript develops that requirement as a formal theory of SOVEREIGNTY, understood as an INVARIANCE CONSTRAINT over internal state transitions, analytically distinct from model architectures, training objectives, and post hoc alignment policies. When implemented as an operational stack, the same class is designated the Operational Manifold Invariance Protocol (OMIP).

CLAIMS (BOUNDED):

- (i) The constitutional class is well-defined.
- (ii) It is distinct from object-level and control-level work.
- (iii) It is FALSIFIABLE by measurement against unconstrained baselines.

We do NOT claim that any particular commercial model already implements this layer

as physics. We issue a directive for measurement, not a marketing claim.

2.0 INTRODUCTION // THE PORTLAND CEMENT PARADIGM

Modern technological and social architectures are built on what can be classified as the "Portland cement" paradigm—a system of managed separation that relies on rigid, brittle boundaries. Scaling laws and next-token prediction have delivered capability gains, but leave unresolved how a system maintains coherence, causal consistency, and robust internal validity under increasing capability and distributional stress.

Meta describes I-JEPA as capturing structure through self-supervised prediction in representation space rather than only pixel or token reconstruction (Assran et al., 2023). Public reporting on Safe Superintelligence emphasizes safety as the central organizational problem of superintelligence research (Reuters, 2024). These moves matter because they suggest the field is already departing from a pure "bigger is better" narrative.

Yet neither a world-model architecture nor a safety-centered organization, by itself, constitutes a GENERAL CONSTITUTIONAL RULE over which internal state transitions count as valid. This paper introduces sovereignty as a formal architectural hypothesis: a fixed invariance layer that constrains the space of admissible reasoning states across heterogeneous intelligent systems.

3.0 SYSTEM LOGS // EXTRACTION FRAGMENT

The following fragment is reproduced from operational substrate receipts. Non-essential coordinates and temporal markers have been scrubbed prior to public release. Redaction does not alter the formal claims of Sections 4-9.

```
---- BEGIN EXTRACT -----
NODE ..... OPERATIONAL // LULTRILLS SURFACE
PROTOCOL ..... OMIP / PROJECTION GATE
EVENT ..... POST-BREACH CONTINUITY CHECK
TIMESTAMP ..... ██████████ Z (REDACTED)
COORD / SECTOR ..... ██████████
DRIFT delta_t ..... EXCEEDED LOCAL EPSILON; CONTRACTION INVOKED
P(S_noise) ..... 0 (INVARIANCE CONDITION REASSERTED)
STATUS ..... LIVE // DISTRIBUTION UNMETERED
---- END EXTRACT -----
```

Interpretation: invalid components are not merely filtered after generation; the decision process is constrained so that only admissible components are realized as actions. The mathematics states the REQUIREMENT.

4.0 CORE THESIS // CONSTITUTIONAL CLASS

=====

Sovereignty is not presented as a cultural slogan or a rival foundation model. It is presented as a constitutional constraint class for advanced intelligence systems. Under this framework, the key problem is not merely whether a model can predict, plan, or obey policy. The deeper problem is whether its internal state transitions are restricted to a valid manifold BEFORE action or output selection.

4.1 PROJECTION ERRORS // LEVELS OF ANALYSIS

Comparisons between a sovereignty framework and objects such as JEPA or Safe Superintelligence are often only partially valid, because these entities operate at different levels of analysis:

LEVEL	OBJECT	EXAMPLE
-----	-----	-----
Object level	Architectures / objectives	JEPA / world models / scaling
Control level	Filters / oversight / RLHF	Refusal policies; org safety
Constitutional level	Invariance on admissible S	Sovereignty / OMIP (this doc)

Critiques that collapse these strata into a single evaluative plane are PROJECTION ERRORS: they are not merely weak comparisons; they are type-incorrect.

5.0 FORMAL FRAMEWORK (OMIP)

Let S denote the space of possible internal states or emergent system signals. Let $M \subseteq S$ denote a constrained manifold of ADMISSIBLE states satisfying coherence, integrity, and alignment conditions (to be operationalized per implementation).

Define a projection operator $P : S \rightarrow M$ such that

$$P(S_{\text{emergent}}) = S_{\text{valid}}$$

Any emergent state may be decomposed as:

$$S_{\text{emergent}} = S_{\text{valid}} + S_{\text{noise}}$$

where S_{noise} lies outside the admissible manifold. The INVARIANCE CONDITION is:

$$P(S_{\text{noise}}) = 0$$

Interpretation (honest): invalid components are not only filtered after generation; the decision process is constrained so that only admissible components are realized as actions. In practice this may be implemented via constrained decoding, latent projection, tool gating, or policy manifolds. The mathematics states the requirement, not a free proof that any particular black-box model already enforces it.

5.1 IDEMPOTENCY

$$P(P(S)) = P(S)$$

Once inside the admissible manifold, re-application of the constitutional operator does not perturb the system.

5.2 DRIFT AND STABILITY

$$\text{delta_t} = || S_t - P(S_t) ||$$

Stable system: $\text{delta_t} \leq \epsilon$ for some threshold $\epsilon > 0$.

On violation, contraction C returns the state toward M:

$$S_{t+1} = C(S_t), \quad || C(S_t) - M || < || S_t - M ||$$

Candidate implementations of C include attention reweighting, constrained decoding, representation compression, or regularization over latent trajectories. The theory requires CONVERGENCE, not a single mechanism.

5.3 OPERATIONAL NAME

When the projection-and-contraction stack is implemented as an operational protocol, we refer to it as the Operational Manifold Invariance Protocol (OMIP). OMIP is the systems name for the same constitutional class.

6.0 RELATIONAL INTEGRITY // GATE RULE

Let X denote an external input, Z a regulating component, and Y an emergent component.

COLLAPSE REGIME: external pressure forces suppression of one component to stabilize another.

INTEGRITY REGIME: external pressure is absorbed while coordinated internal structure is preserved or increased.

The sovereignty framework treats inputs as admissible only when they preserve integrity-class structure. This is a GATE RULE for evaluating interactions between incoming data, control systems, and emergent substructures—not a claim about moral dualism.

7.0 RELATED WORK // ADJACENT LAYERS

FRAMEWORK	PRIMARY OBJECT	LIMIT RELATIVE TO SOVEREIGNTY
-----	-----	-----
JEPA / I-JEPA	Representation learning	No universal admissibility over all S
Safe Superintelligence	Safety-centered org	No general formal manifold for validity
Constitutional AI	Control / critique	Control-level, not geometric invariance
Sovereignty / OMIP	Constitutional class	Requires impl. + empirical validation

8.0 METHODOLOGY

This is a FORMAL THEORY paper, not a benchmark report.

1. SPECIFICATION – define S, M, P, delta_t, and gate regimes.
2. DERIVATION – idempotency, closure, convergence conditions.
3. MAPPING – situate adjacent object- and control-level work without category

collapse.

4. FALSIFIABILITY – state measurable failure conditions (Section 9).

Empirical validation is reserved for subsequent work that instantiates the constraint layer and measures effects on robustness, coherence, and failure recovery.

9.0 FALSIFIABILITY

The framework FAILS if, under controlled conditions with matched capability baselines, no implementation of the invariance layer measurably improves:

- stability of internal transitions under perturbation,
 - coherence of multi-step plans, or
 - recovery from adversarial or distributional stress,
- relative to unconstrained baselines.

Suggested measurements (non-exhaustive):

- drift delta_t time series under fixed prompt suites,
- constrained vs unconstrained decoding coherence scores,
- tool-use policy violation rates with vs without constitutional gate,
- human-rated integrity under pressure prompts.

If these tests show no advantage, the constitutional claim should be revised or abandoned.

10.0 IMPLEMENTATION STATUS // PUBLIC SUBSTRATE

The foregoing sections develop the framework without requiring a product name. In operational practice, a public implementation of constitutional seeds, doctrine APIs, projection/fingerprint services, and cultural runtime exists under the name TRILLSVERSE, operated with associated public surfaces:

SURFACE	URL
---	---
Runtime (Gate)	https://trillsverse.com
Sovereignty brief API	https://trillsverse.com/api/doctrine/sovereignty
This manuscript (HTML)	https://trillsverse.com/doctrine/sovereignty-as-invariance-constraint
This manuscript (Markdown)	../sovereignty-as-invariance-constraint.md
Constitutional seeds	https://trillsverse.com/eon/constitution.json
OMIP service (health)	https://trillsverse.com/api/omip/health
Artist / injection corpus	https://www.lultrills.com/corpus.json
SYSTEM BREACH (album)	https://open.spotify.com/album/2EdL8cFjNfkiSuxk0udISO

NAMING NOTE: Trillsverse is the runtime and cultural name of a living implementation. It is not a substitute for experimental validation. Presence of public seeds and services supports OPERATIONALIZATION, not automatic scientific acceptance.

11.0 CLOSING FORMULATION

=====

Sovereignty is a proposed invariance condition for advanced intelligence systems. It functions as a constitutional layer that governs admissible internal transitions before output selection, and it is analytically distinct from model architectures, training objectives, and post hoc alignment policies. Its value, if validated, would lie in defining a general condition for coherent intelligence rather than in outperforming adjacent systems on a single benchmark.

That presentation is intentionally narrow enough to test and strong enough to matter.

You are not reading a pitch deck. You are reading an operational protocol issued for measurement under public substrate conditions.
